import string
import re
from sklearn.model_selection import train_test_split
```

Tasks 1: Extracting features (60 points)

1. Data preparation (20 points)

A. Data preprocessing (10 points): Download and load the dataset. Please process the reviews by (i) converting all text to lowercase to ensure uniformity, (ii) removing punctuations, numbers, and stopwords, and (iii) tokenizing the reviews into tokens. If you plan to work on the binary classification problem, you will need to assign binary class labels based on the above-mentioned strategy.

```
In [97]: df = pd.read_csv('./amazon_reviews.csv')
df.head()
```

```
Out[97]:
```

	overall	reviewText
0	4	No issues.
1	5	Purchased this for my device, it worked as adv...
2	4	it works as expected. I should have sprung for...
3	5	This think has worked out great.Had a diff. br...
4	5	Bought it with Retail Packaging, arrived legit...

```
In [98]: nltk.download('stopwords')
stop_words = set(stopwords.words('english'))
punct = string.punctuation
numbers = string.digits

def clean_text(text):
    if pd.isnull(text):
        return ""
    # Convert to lowercase
    text = text.lower()
    # Remove punctuation and numbers
    text = text.translate(str.maketrans('', '', punct + numbers))
```

```

# Remove stopwords and return tokens
tokens = text.split()
tokens = [word for word in tokens if word not in stop_words]
return tokens

df['reviewText'] = df['reviewText'].apply(clean_text)

```

```

[nltk_data] Downloading package stopwords to
[nltk_data] C:\Users\abdul\AppData\Roaming\nltk_data...
[nltk_data] Package stopwords is already up-to-date!

```

```
In [99]: df['reviewText'].head()
```

```

Out[99]: 0                                [issues]
1    [purchased, device, worked, advertised, never,...

3    [think, worked, greathad, diff, bran, gb, card...
4    [bought, retail, packaging, arrived, legit, or...
Name: reviewText, dtype: object

```

2. Data split (5 points): Split the data with the ratio of 0.8, 0.1, and 0.1 into training, validation/development, and testing, respectively.

```
In [100]: df['overall'].value_counts()
```

```

Out[100]: overall
5      3922
4       527
1       244
3       142
2        80
Name: count, dtype: int64

```

```

In [101]: def map_label(num):
            if num in [1, 2]:
                return 0 #Negative Review
            elif num in [4, 5]:
                return 1 # positive review
            else:
                return 2 #neutral

df['overall'] = df['overall'].apply(map_label)

```

```
In [102]: df['overall'].value_counts()
```

```

Out[102]: overall
1      4449
0       324
2       142
Name: count, dtype: int64

```

0 -> Negative Review

2 -> Neutral Review (will combine this with negative this for binary classification)

1 -> Positive Review

Splitting the data to ensure an equal proportion of each 'overall' rating in the training, validation, and test sets. For example, if there are only 142 observations for neutral(1), 80% will go to training, 10% to validation, and 10% to testing. For this we will use the stratify in train_test_split()

```
In [103... X = df['reviewText']  
y = df['overall']
```

```
In [104... X_train , X_temp , y_train , y_temp = train_test_split( X , y ,  
                                                         test_size= 0.2 , # 26  
                                                         stratify= y,      # ke  
                                                         random_state=42) # re
```

```
In [105... X_val , X_test , y_val , y_test = train_test_split(X_temp,y_temp,  
                                                         test_size=0.5, #50% of 26  
                                                         stratify=y_temp,  
                                                         random_state=42)
```

3. Data statistics (5 points): Please conduct an analysis of the basic statistics of the data you obtained. For example, you can consider the following aspects, number of data samples in training/development/testing, minimum/average/maximum number of tokens across all reviews, number of positive/negative reviews in training/development/testing. You can also provide other basic statistics of the data if you think they are important. Please report these as the table or plots.

```
In [106... print("Train size:", len(X_train))  
print("Val size:", len(X_val))  
print("Test size:", len(X_test))  
  
print("Label distribution in Train:\n", y_train.value_counts(normalize=True))  
print("Label distribution in Val:\n", y_val.value_counts(normalize=True))  
print("Label distribution in Test:\n", y_test.value_counts(normalize=True))
```

```

Train size: 3932
Val size: 491
Test size: 492
Label distribution in Train:
overall
1    0.905137
0    0.065870
2    0.028993
Name: proportion, dtype: float64
Label distribution in Val:

    'Min Tokens': [X_train.apply(len).min(), X_val.apply(len).min(), X_test.
    'Avg Tokens': [X_train.apply(len).mean(), X_val.apply(len).mean(), X_test.
    'Max Tokens': [X_train.apply(len).max(), X_val.apply(len).max(), X_test.
})
token_stats

```

```

Out[107...

```

	Set	Min Tokens	Avg Tokens	Max Tokens
0	Train	0	25.423449	781
1	Validation	1	25.851324	347
2	Test	1	24.601626	544

2. Representation of Texts: word vectors (40 points)

A. Count-based word vectors with co-occurrence matrix (20 points, 5 points for each question)

- Please implement a function named `get_vocab(corpus)` that returns `corpus_words`, which is the list of all the distinct words used in the review corpus. You can do this with 'for' loops, but it's more efficient to do it with Python list comprehensions. The returned `corpus_words` should be sorted. You can use python's `sorted` function for this.

```

In [108... def get_vocab(corpus):
    """ Determine a list of distinct words for the corpus.
    Params:
        corpus (list of list of strings): corpus of documents
    Return:
        corpus_words (list of strings): sorted list of distinct words ac

```

```

        n_corpus_words (integer): number of distinct words across the co
    """
    distinct_words = []

    # Iterate through each list in the corpus
    for i in range(len(corpus)):
        for word in corpus[i]:

            # Check that a word is not in the list of distinct words
            if word not in distinct_words:

                # Add a word to the list
                distinct_words.append(word)

    # Ascending sort the list of distinct words
    corpus_words = sorted(distinct_words)

    return corpus_words

corpus_words = get_vocab(df['reviewText'])
print("Distinct words:", corpus_words)

```

Distinct words: ['aac', 'aas', 'aba', 'abdroid', 'abilities', 'ability', 'able', 'aboutgood', 'abouti', 'abouttherehere', 'aboutto', 'abovei', 'abroad', 'abruptly', 'absolute', 'absolutely', 'abt', 'abuse', 'abused', 'abysmal', 'accdientally', 'accept', 'acceptable', 'acceptably', 'accepted', 'accepting', 'accepts', 'access', 'accessed', 'accesses', 'accessible', 'accessing', 'accessories', 'accessory', 'accessoryalternative', 'accident', 'accidentally', 'accidentally', 'acclimated', 'accolades', 'accommodate', 'accomplish', 'accord', 'according', 'accordingly', 'account', 'accros', 'accurate', 'accuratei', 'accuratethe', 'ace', 'acer', 'acess', 'acheive', 'achieve', 'achieved', 'achievedusing', 'achieves', 'acitve', 'acknowledge', 'acknowledged', 'a contourroam', 'acquire', 'acquired', 'acronis', 'acronyms', 'across', 'act', 'acting', 'action', 'actioncam', 'activating', 'active', 'activity', 'acts', 'actual', 'actuality', 'actually', 'ad', 'adapater', 'adapt', 'adapted', 'adapter', 'adapterbased', 'adapterbingo', 'adapterbqzhjs', 'adapterexchangin', 'adapterfunny', 'adapteri', 'adapterit', 'adapterive', 'adapterlifetime', 'adapterlol', 'adapterother', 'adapterprecautions', 'adapterpretty', 'adapters', 'adaptersamsung', 'adaptersandisk', 'adaptersshipping', 'adaptersome', 'adaptersuper', 'adapterthis', 'adapterwhich', 'adapterwith', 'adapterwithout', 'adapterworks', 'adaptor', 'adaptnow', 'adaptors', 'adaptorsthat', 'adaquate', 'adata', 'adatas', 'add', 'added', 'adding', 'addingdeletingmoving', 'addition', 'additional', 'additional', 'addon', 'address', 'addresse', 'adds', 'addsi', 'adequate', 'adequatei', 'adequately', 'adjust', 'admiral', 'admit', 'admits', 'admitted', 'admittedly', 'adn', 'adopter', 'adopting', 'adpator', 'ads', 'adult', 'advance', 'advanced', 'advancing', 'advantage', 'adventure', 'adventures', 'adventuresthis', 'adversities', 'advertise', 'advertised', 'advertisedgood', 'advertisedi', 'advertisedif', 'advertisedthis', 'advertisedwhat', 'advertisement', 'advertisements', 'advertises', 'advertising', 'advertized', 'advice', 'advise', 'advised', 'adware', 'aelago', 'aerobic', 'affect', 'affected', 'affecting', 'afford', 'affordable', 'affpa', 'afraid', 'aft', 'afternoon', 'afterward', 'afterwards', 'againalso', 'againas', 'againdecember', 'againedit', 'againi', 'againif', 'againit', 'againlolgo', 'againspeed', 'againwriting', 'age', 'agent', 'agents', 'aging', 'ago', 'agoi', 'agothankfully', 'agoworks', 'agptek', 'agree', 'agreed', 'ah', 'ahaha', 'ahead', 'aiiiighsuperspeedy', 'ainol', 'aint', 'air', 'airdroid', 'airplane', 'airport', 'aka', 'akingston', 'al', 'alamcenar', 'alaska', 'alaskai', 'albeit', 'album', 'albums', 'aldo', 'alec', 'alert', 'alerted', 'alerting', 'alerts', 'alien', 'alike', 'alla', 'allbased', 'allblack', 'alldaym', 'alltm', 'alleged', 'allegedly', 'allexcellent', 'allgb', 'allhave', 'alli', 'allinone', 'allinstallation', 'allocated', 'allocation', 'allot', 'allotted', 'allow', 'allowed', 'allowing', 'allows', 'allpurpose', 'allready', 'allsome', 'although', 'almost', 'almsot', 'alone', 'alonethe', 'along', 'alot', 'already', 'alreadythis', 'alright', 'also', 'alsobuying', 'alt', 'alta', 'altered', 'alternately', 'alternative', 'although', 'altogether', 'altogetherwhen', 'altough', 'aluminum', 'alway', 'always', 'alwayspros', 'alzheimers', 'amamazon', 'amazed', 'amazementit', 'amazes', 'amazing', 'amazingi', 'amazingly', 'amazingsandisk', 'amazon', 'amazonas', 'amazoncom', 'amazonconits', 'amazonenjoy', 'amazonfrustrating', 'amazoni', 'amazonpackage', 'amazonprime', 'amazons', 'amazonseeing', 'amazonsincerelykj', 'amazonso', 'amazonthe', 'amazonthey', 'america', 'amis', 'ammount', 'amon', 'among', 'amonths', 'amount', 'amounts', 'ample', 'ampliamente', 'ana', 'anbd', 'andi', 'andiod', 'andloaded', 'andoid', 'andor', 'andriod', 'androd', 'android', 'androidread', 'androidspecific', 'ands', 'andthats', 'andy', 'anecdotal', 'anelago', 'angle', 'angryto', 'anime', 'anker', 'anniversary', 'announced', 'announcement', 'annoyance', 'annoyed', 'annoying', 'anomaly', 'another', 'anotherbigger', 'anothergreat', 'answer', 'answered', 'answers', 'answersthanks', 'anteriormente', 'anticipated', 'anticipating', 'anticipation', 'antishoplif

2. 1b) Based on the word vocabulary obtained with `get_vacab(corpus)` function, please implement a function named `compute_co_occurrence_matrix(corpus, window_size=4)` that returns both `M` and `word2index`. Here, `M` is the co-occurrence matrix of word counts and `word2index` is a dictionary that maps word to index. The function constructs a co-occurrence matrix for a certain window-size n (with a default of 4), considering words n before and n after the word in the center of the window. You can use `numpy` to represent vectors, matrices, and tensors.

```
In [109... def compute_co_occurrence_matrix(dataset, corpus_words, window_size=4):

    """ Compute co-occurrence matrix for the given corpus and window_size (c
    Params:
        dataset (dataframe): the original dataset of reviews
        corpus_words (list of strings): the list of strings that contain
        window_size (int): size of context window
    Return:
        M (a symmetric numpy matrix of shape (number of unique words in
        Co-occurrence matrix of word counts.
        The ordering of the words in the rows/columns should be the
        word2index (dict): dictionary that maps word to index (i.e. row/
    """

    # Initialize the co-occurrence matrix M with zeros
    M = np.zeros((len(corpus_words), len(corpus_words)))

    # Create a hashmap to map the relationship between word and index (word
```

```

word2index = {}
for index, word in enumerate(corpus_words):
    word2index[word] = index

# Iterate through each list of strings in the corpus
for words_list in dataset['reviewText']:

    # Iterate through each word in a list of strings
    for index, word in enumerate(words_list):
        # Get the index of a center word, return -1 if not found the word
        center_word_index = word2index.get(word, -1)

        # Check if the word is found in the hashmap
        if center_word_index != -1:
            # Define the boundaries of the window
            start = max(0, index - window_size)
            end = min(len(words_list), index + window_size + 1)

            # Iterate through the words in the window
            for index_in_window in range(start, end):

                if index_in_window == index:
                    continue
                else:
                    # Get the word of the current index in the window
                    word_in_window = words_list[index_in_window]
                    # Get the index of the current word in the window
                    word_in_window_index = word2index.get(word_in_window, -1)

                    # Count the co-occurrence words in the co-occurrence matrix
                    M[center_word_index][word_in_window_index] += 1

    return M, word2index

# Print to check the output from compute_co_occurrence_matrix function
M, word2index = compute_co_occurrence_matrix(df, corpus_words)

```

```

In [110]: print("Word to Index mapping:\n", word2index)
          print("\nCo-occurrence Matrix:\n", M)

```

2. 1c). Please implement a function named `reduce_to_k_dim(M)` performs dimensionality reduction on the matrix `M` to produce `k`-dimensional embeddings and returns the new matrix `M_reduced`. Use SVD (use the implementation of Truncated SVD in `sklearn`)

sklearn.decomposition.TruncatedSVD, set `n_iters = 10`) to take the top `k` components and produce a new matrix of `k`-dimensional embeddings.

```
In [112... from sklearn.decomposition import TruncatedSVD
```

```
In [113... def reduce_to_k_dim(M, k=2, random_state=0):
    """
    Reduce a co-occurrence matrix M to k-dimensional embeddings via TruncatedSVD

    Params:
        M (np.ndarray or scipy.sparse matrix): shape (V, V) co-occurrence matrix
        k (int): target embedding dimensionality
        random_state (int): RNG seed for reproducibility

    Returns:
        M_reduced (np.ndarray): shape (V, k) matrix of k-d embeddings (one row per word)
    """
    # Ensure numeric dtype
    if hasattr(M, "dtype") and M.dtype != np.float64:
        M = M.astype(np.float64)

    svd = TruncatedSVD(n_components=k, n_iter=10, random_state=random_state)
    M_reduced = svd.fit_transform(M) # rows map to k-d embeddings

    return M_reduced

M_reduced = reduce_to_k_dim(M)
M_reduced
```

```
Out[113... array([[ 0.12847699, -0.100692  ],
        [ 0.18756318, -0.03328681],
        [ 1.64769209,  1.1555967 ],
        ...,
        [ 1.072553   ,  0.60869125],
        [ 1.27786908,  0.22847562],
        [ 0.09719139, -0.02289483]])
```

2. 1d) Implement `plot_embeddings(M_reduced, word2index, words_to_plot)` to plot in a scatterplot the embeddings of the words specified in the list `'words_to_plot'`. Here, `'M_reduced'` is the matrix of 2-dimensional word embeddings obtained in question c. `word2index` is the dictionary that maps words to indices for the embedding matrix obtained in question b. Use the implemented function to get the plot for the following list of words `words_to_plot=['purchase', 'buy', 'work', 'got', 'ordered', 'received', 'product', 'item', 'deal', 'use']`, and show the plot.

```
In [114... import matplotlib.pyplot as plt
import seaborn as sns
```

```
In [115... def plot_embeddings(M_reduced, word2index, words_to_plot, figsize=(6, 6)):
    """
```

Plot 2D embeddings for a selected set of words.

Params:

M_reduced: numpy array of shape (num_words, 2), e.g., output of redu
word2index: dict mapping word -> row index in M_reduced
words_to_plot: list[str] of words to annotate on the scatter plot
figsize: figure size tuple

Returns:

(fig, ax): Matplotlib figure and axes

"""

```
if M_reduced.shape[1] != 2:
```

```
    raise ValueError("M_reduced must have 2 columns (k=2).")
```

```
present = [w for w in words_to_plot if w in word2ind]
```

```
missing = [w for w in words_to_plot if w not in word2ind]
```

```
if not present:
```

```
    raise ValueError("None of the requested words are in word2ind.")
```

```
coords = np.array([M_reduced[word2ind[w]] for w in present])
```

```
fig, ax = plt.subplots(figsize=figsize)
```

```
ax.scatter(coords[:, 0], coords[:, 1])
```

```
# label each point
```

```
for w, (x, y) in zip(present, coords):
```

```
    ax.annotate(w, (x, y), xytext=(3, 3), textcoords="offset points")
```

```
ax.set_xlabel("SVD-1")
```

```
ax.set_ylabel("SVD-2")
```

```
ax.set_title("2D Word Embeddings")
```

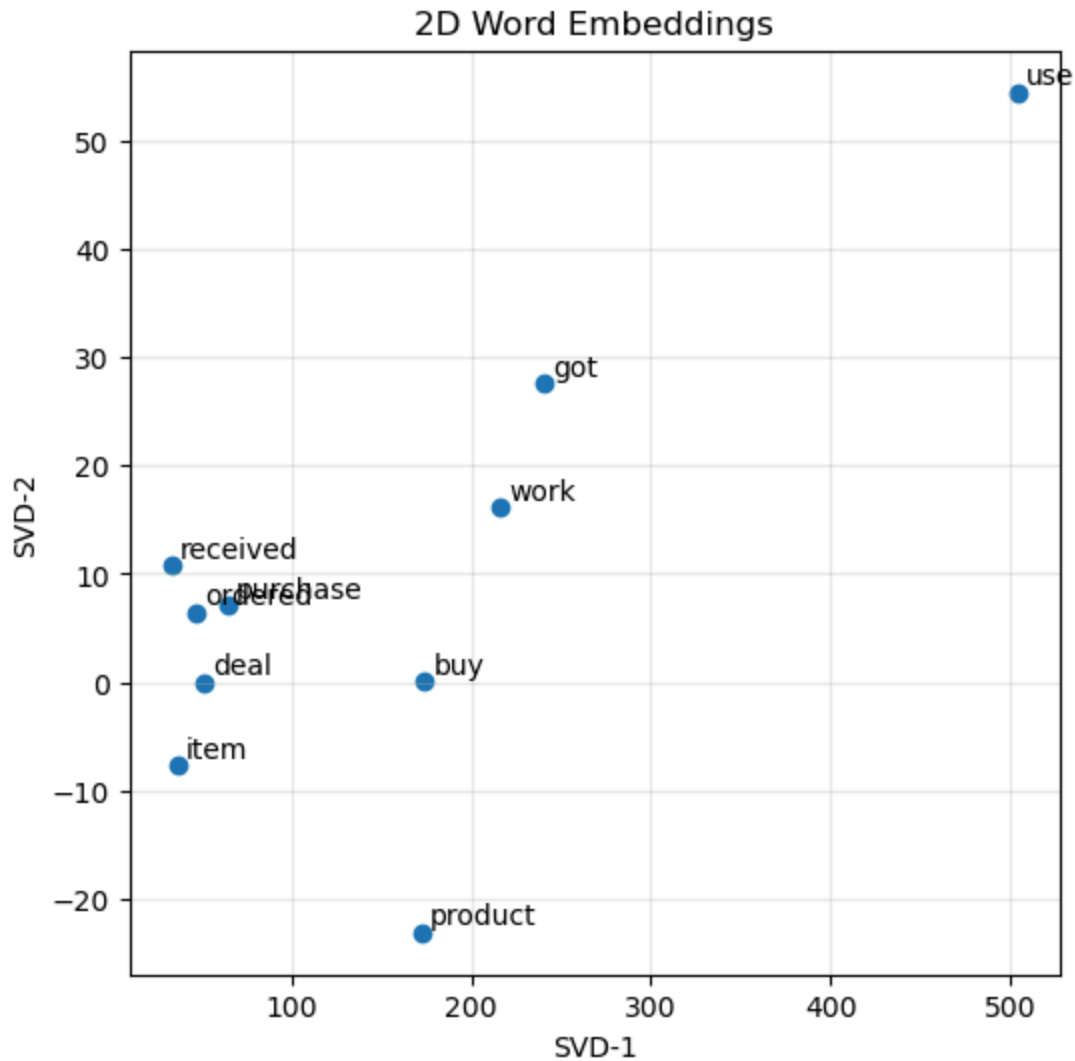

```
ax.grid(True, alpha=0.3)
```

```
if missing:
```

```
    print("Skipped missing words:", missing)
```

```
return fig, ax
```

```
In [116... words_to_plot = ["purchase", "buy", "work", "got", "ordered", "received", "p  
_ = plot_embeddings(M_reduced, word2ind, words_to_plot)
```

2) Prediction-based word vectors from Glove (20 points, 5 points for each question)

1) Please use the provided `load_embedding_model()` function to load the GloVe

embeddings. Note: If this is your first time to run these cells, i.e. download the embedding model, it will take a couple minutes to run. If you've run these cells before, rerunning them will load the model without redownloading it, which will take about 1 to 2 minutes.

```
In [117... def load_embedding_model():
    """ Load GloVe Vectors
    Return:
    wv_from_bin: All 400000 embeddings, each length 200
    """
    import gensim.downloader as api
    wv_from_bin = api.load("glove-wiki-gigaword-200")
    print("Loaded vocab size %i" % len(list(wv_from_bin.index_to_key)))
```

```

    return wv_from_bin
# -----
# Run Cell to Load Word Vectors
# Note: This will take a couple minutes
# -----
wv_from_bin = load_embedding_model()

```

Loaded vocab size 400000

2. Select the words in the vocabulary returned in 1)a and get the corresponding GloVe vectors. You can adapt the provided function `get_matrix_of_vectors(wv_from_bin, required_words)` to select the Glove vectors and put them in a matrix M.

```

In [118... def get_matrix_of_vectors(wv_from_bin, required_words):
    """ Put the GloVe vectors into a matrix M.
    Param:
    wv_from_bin: KeyedVectors object; the 400000 GloVe vectors loaded from f
    Return:
    M: numpy matrix shape (num words, 200) containing the vectors
    word2ind: dictionary mapping each word to its row number in M
    """
    import random
    words = list(wv_from_bin.index_to_key)
    print("Shuffling words ...")
    random.seed(225)
    random.shuffle(words)
    words = words[:]
    print("Putting %i words into word2index and matrix M..." % len(required_
    word2index = {}
    M = []
    curIndex = 0
    default_vector = np.zeros(200)

    # Get the vectors of the required words
    for word in required_words:
        if word in words:
            M.append(wv_from_bin.get_vector(word))
            word2index[word] = curIndex
            curIndex += 1
        else:
            # Replace missing words with a defined default vector
            M.append(default_vector)
            # Map the relationship between key: word, and value: index of th
            word2index[word] = curIndex
            curIndex += 1
    M = np.stack(M)
    print("Done.")
    return M, word2index

```

```

In [119... vocab = get_vocab(df['reviewText'])
M_glove, word2index_pred_based = get_matrix_of_vectors(wv_from_bin, vocab)
M_glove

```

Shuffling words ...

Putting 9697 words into word2index and matrix M...

Done.

```

3. Use the function `reduce_to_k_dim()` you implemented in 1)c to reduce the vectors to 2 dimension. Similar to what you did in 1)c.

```
In [122]: M_2d = reduce_to_k_dim(M_glove, k=2, random_state=0)
```

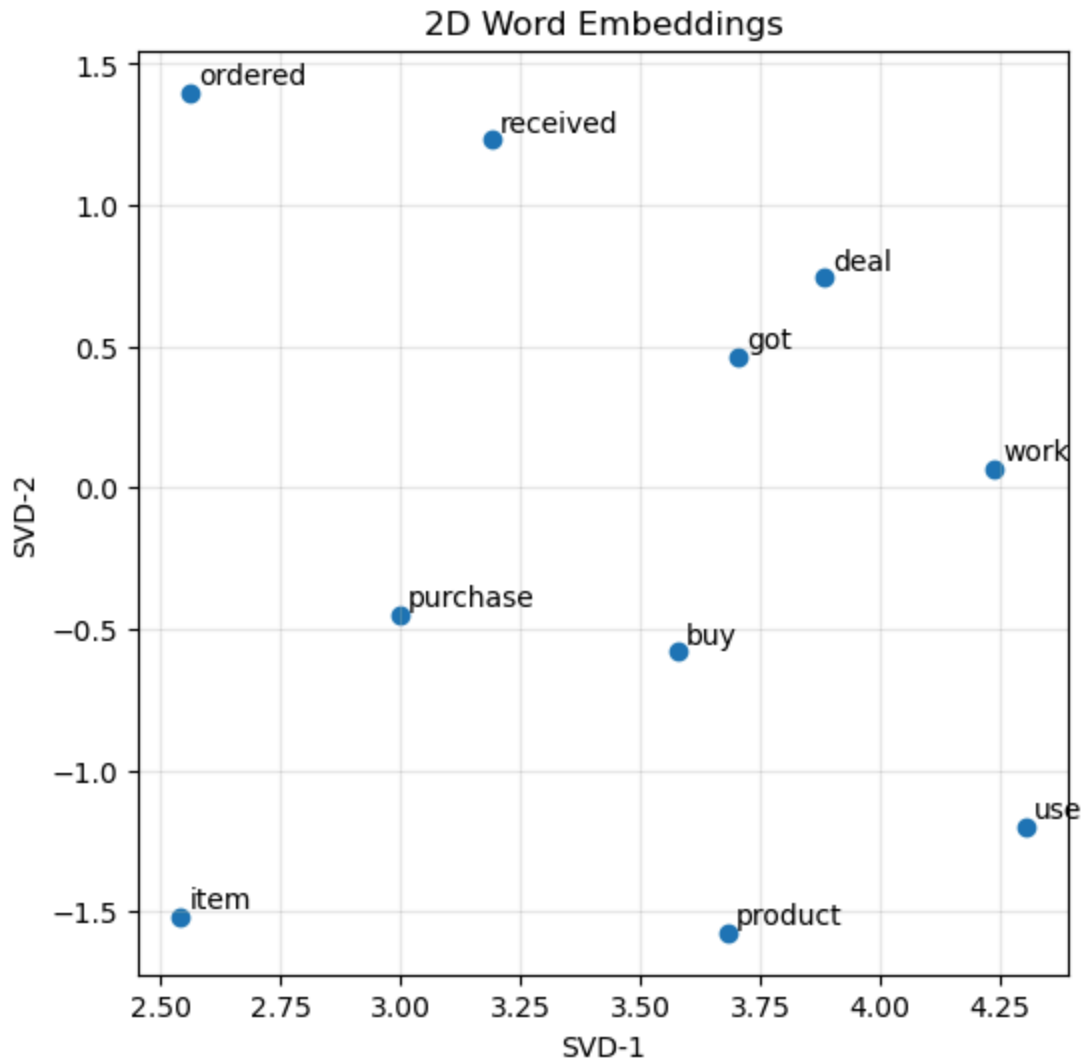

```
print("Original:", M_glove.shape, "-> Reduced:", M_2d.shape)
```

Original: (9697, 200) -> Reduced: (9697, 2)

4)`Use the plot_embeddings function in 1)d to get the plot for the same set of words in 1)d. Compare the differences of the plot in 1)d and 2)d, provide some analysis, and describe your findings.

```
In [123... plot_embeddings(M_2d, word2index_pred_based, words_to_plot)
```

```
Out[123... (<Figure size 600x600 with 1 Axes>,  
<Axes: title={'center': '2D Word Embeddings'}, xlabel='SVD-1', ylabel='SVD-2'>)
```

Both methods capture distributional similarity. Co-occurrence+SVD reflects corpus-specific contexts and yields compact clusters for transaction terms in our reviews. GloVe, trained on a large general corpus, shows similar neighborhoods but the first principal direction and the 2D linear projection make clusters appear less tight in our plot. After normalization or non-linear projection, GloVe also exhibits clear semantic grouping.

Task 2: Sentiment Classification Algorithms (40 points)

3. Perform sentiment analysis with classification

1. Review embeddings (5 points): Similar to what you did in 2)c, use the function `reduce_to_k_dim()` you implemented in 1)c to reduce the vectors to 128 dimension. Based on the word embeddings, get the review embedding by taking the average of the word embeddings in each review. Write a function for getting review embeddings for each review.

```
In [124... def get_average_embeddings(M_reduced, dataset, word2index, col='reviewText')
    """
    M_reduced: (V, 128) word embeddings aligned to word2index
    dataset[col]: iterable of token lists
    """
    N, K = len(dataset), M_reduced.shape[1]
    review_embeddings = np.zeros((N, K), dtype=np.float32)

    for i, doc in enumerate(dataset[col]):
        # ensure a list of tokens
        if not isinstance(doc, (list, tuple)):
            doc = [] if doc is None else str(doc).split()

        # keep only tokens present in the vocab
        idxs = [word2index[w] for w in doc if w in word2index]

        if idxs: # avoid divide-by-zero
            review_embeddings[i] = M_reduced[idxs].mean(axis=0)

    return review_embeddings

# Reduce the dimensionality of matrix M with k = 128
M128 = reduce_to_k_dim(M_glove, k=128)

# Call a function "get_average_embeddings" to get the average of words embed
review_embeddings = get_average_embeddings(M128, df, word2index_pred_based)
review_embeddings_dataframe = pd.DataFrame(review_embeddings)
new_dataset = pd.concat([df, review_embeddings_dataframe], axis=1)
new_dataset
```

C:\Users\abdul\AppData\Local\Temp\ipykernel_205272\1261868208.py:2: FutureWarning: ChainedAssignmentError: behaviour will change in pandas 3.0!

You are setting values through chained assignment. Currently this works in certain cases, but when using Copy-on-Write (which will become the default behaviour in pandas 3.0) this will never work to update the original DataFrame or Series, because the intermediate object on which we are setting values will behave as a copy.

A typical example is when you are setting values in a column of a DataFrame, like:

```
df["col"][row_indexer] = value
```

Use `df.loc[row\_indexer, "col"] = values` instead, to perform the assignment in a single step and ensure this keeps updating the original `df`.

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#returning-a-view-versus-a-copy

```
new_dataset['overall'] [new_dataset['overall'] == 2] = 0
C:\Users\abdul\AppData\Local\Temp\ipykernel_205272\1261868208.py:2: SettingWithCopyWarning:
```

A value is trying to be set on a copy of a slice from a DataFrame

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#returning-a-view-versus-a-copy

```
new_dataset['overall'] [new_dataset['overall'] == 2] = 0

auc score 0.8775041836002869

classification report:

	precision	recall	f1-score	support
0	0.84	0.34	0.48	47
1	0.93	0.99	0.96	445
accuracy			0.93	492
macro avg	0.89	0.67	0.72	492
weighted avg	0.93	0.93	0.92	492

confusion matrix:

```
[[ 16  31]
 [   3 442]]
```

Both models reach similar accuracy around 0.93, which is driven by the strong majority of positive reviews (445 vs 47). Accuracy alone is not very informative under this imbalance.

Logistic Regression improves recall on the negative class from 0.34 → 0.43 and raises its F1 from 0.48 → 0.56, while keeping positive-class performance nearly unchanged. The NN has higher precision for negatives (0.84 vs 0.80) but misses more of them, leading to lower recall.

LR has higher AUC (0.707 vs 0.667), indicating better separation of classes across thresholds.

LR catches more true negatives (20 vs 16) and reduces false positives on the negative class (27 vs 31), at a tiny cost to positive recall.

Question	Answers (provide the answer index)
Q1: Rate your performance 1-Very unsatisfied 2-Somewhat unsatisfied 3-Neutral 4-Somewhat satisfied 5-Very satisfied	4
Q2: How much does your understanding of the concepts influence your performance? 1-Very unimportant 2-Somewhat unimportant 3-Neutral 4-Somewhat important 5-Very important	5
Q3: How much does the design of the examples/questions (is relatable to you) influence your performance? 1-Very unimportant 2-Somewhat unimportant 3-Neutral 4-Somewhat important 5-Very important	5
Q4: When you answer Q3, which are the primary <u>factors</u> influencing the relatability of the examples to you? 1-Gender 2-Race 3-Age 4-Culture background 5- Socioeconomic Status 6- Hobbies and interests 7- Prior knowledge about the context in the example 8-Others (specify it in the answer)	7
